 characterization of the kallikrein gene family.";

Biochim. Blophys. Acta 866:1-14(1986).

-! FUNCTION: GLANULHAR KALLIKREINS CLEAVE MET-LYS AND ARG-SER BONDS.

-! CATALYTIC ACTIVITY: Preferential cleavage of Arg-|-Xaa bonds in small molecule substrates. Highly selective action to release kallidin (1981-bradykinin) from kininogen involves hydrolysis of Met-|-Xaa or Leu-|-Xaa.

-! SIMILARITY: BELONGS TO BEPTIDASE FAMILY S1; ALSO KNOWN AS THE TRYPSIN FAMILY. KALLIKREIN SUBFAMILY.
 MEDLINE-89214217; PubMed-2708383; Wines D.R., Brady J.M., Pritchett D.B., Roberts J.L., Macdonald R.J.; Wines D.R., Pardy J.M., Pritchett D.B., Roberts J.L., Macdonald R.J.; "Organization and expression of the rat kallikrein gene family."; J. Biol. Chem. 264:7653-7662(1989).

 TISSUE SPECIFICITY: KIDNEY AND SUBMANDIBULAR GLAND, WHERE IT IS.
FOUND IN THE GRANULAR CONVOLUTED TUBBLE AND STRATED DUCT CELLS.
IT IS LIKELY THAT THE BRYME IS MAINLY SYNTHESIZED IN THE GRANULAR
CONVOLUTED TUBULES AND THEN TRANSFERRED TO OTHER TISSUES BY
RELEASE INTO THE VASCULATURE OR INTERSTITAL SPACE.

PTM: PROBABLY N- AND O-GLYCOSYLATED. IT HAS CARBOHYDBATE MOIETIES
OF ALPHA-METHYL-D-MANNOSIDE AND N-ACETYL-D-GLUCOSAMINE GROUPS.
 J. BIOCHEM. 102:1389-1404(1987).

-!- FUNCTION: GLANDULAR KALLIKREINS CLEAVE MET-LYS AND ARG-SER BONDS IN KININOGEN TO RELEASE LYS-BRADYKININ. THIS PROTEIN MAY BE INVOLVED IN THE REGULATION OF RENAL FUNCTION.

-!- CATALYTIC ACTIVITY: Preferential cleavage of Arg-1-Xaa bonds in small molecule substrates. Highly selective action to release kallidin (19x1-bradykinin) from kininogen involves hydrolysis of Met-1-Xaa or Leu-1-Xaa.

-!- SUBUNIT: HETERODIMER OF A LIGHT CHAIN AND HEAVY CHAIN LINKED BY A DISULFIDE BOND.
 MEDLINE-88198057; PubMed-3482210; Kato H., Nakanishi E., Enjyoji K., Hayashi I., Oh-Ishi S., Iwanaga S. "Characterization of serine proteinases isolated from rat submaxillary gland: with special reference to the degradation of rat

Sequence 4, Application US/09027337B

Batent No. 5972616

GENERAL INFORMATION:
APPLICANT: O'Brien, Timothy J.
APPLICANT: Tanimothy J.
APPLICANT: Tanimothy J.
TITLE OF INVENTION: TANG-15: An Extracellular Serine Protease Overexpressed in TITLE OF INVENTION: Breast and Ovarian Carcinomas
TITLE OF ERPRINGE: D6064
CURRENT APPLICATION NUMBER: US/09/027,337B
CURRENT APPLICATION NUMBER: US/09/027,337B
NUMBER OF SEQ ID NOS: 13
 OTHER INFORMATION: Serine protease catalytic domain of Scce homologous to OTHER INFORMATION: similar domain in TADG-15

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide.
 ö
 The present invention relates to human tumour antigen-derived gene 15 (TADG-15) protein and coding sequence (see AAH23601 and AAB98500).
TADG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protease activity are useful for vaccinating an individual against TADG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15.
 Novel extracellular serine protease, termed tumor antigen-derived gene

 the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAT997983) obtd. from a human lung library. Recombinant protease can be produced in transformed or transfected prokaryotic (Partic. E. coli) or eukaryotic (Partic. AV-120 host cells. It is used to develop products for the design and testing of cpds. useful for treating or preventing conditions associated with beta-amyloid peptide, esp. Alzheimer's disease.

(HUMA-) HUMAN GENOME SCI INC

Ruben SM. Rosen CA, Barash SC,

WPI; 2001-465566/50. N-PSDB; AAS41087.

Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous diseases

Claim 11; SEQ ID No 1213; 1180pp; English.

The present invention relates to the isolation of novel human enzyme polypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of diagnosis, including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AlDS) autoimmune disorders (e.g. arthitis), neurological disorders (e.g. Alzhelmer's disease), metabolic disorders (e.g. phenylketonuria), inflammatory disorders

The present invention relates to the isolation of novel human enzyme polypeptides, and the CDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. Alzheimer's disease), metabolic disorders (e.g. phenylketonuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atheroscierosis), blood related disorders (e.g. thampolicity disorders (e.g. thenophilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The polynucleotides of the invention can also be used in gene therapy.
 Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous

Novel polypeptides and polynucleotides useful as diagnostic reagents t diagnose diseases or disorders associated with aberrant expression or activity of polypeptides, for treating blood clotting disorder, haemophilia

S

Claim 11; SEQ ID No 284; 601pp; English.

The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebral isolaemia, angiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi nsed and ocular disorders e.g. corneal infection, and many other disorders listed in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be us a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present

;
 The present sequence is kallikrein-like protein KLK-LJ. Kallikreins and kallikrein-like proteins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding kallikrein-like proteins KLK-LJ, KLK-LZ, KLK-LJ, KLK-LZ, KLK-LJ, KLK-LZ, KLK-LJ, KLK-LS, and KLK-LB, have been isolated. The proteins are useful in the treatment, monitoring and diagnosis of cancers, especially prostrate cancer. They can also be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies on be used to treat conditions mediated by the kallikrein-like proteins.
 New kallikrein-like (KLK-L) proteins for diagnosing and treating KLK-L protein mediated disorders, especially cancer. -

Tabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosting a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunoasorbant assays (ELISA). Disorders which are diagnosed or treated immunosorbant assays (ELISA). Disorders which archititis, include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. encephasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrand isorders e.g. corneal infection, and many other and ocular disorders e.g. corneal infection, and many other disorders e.g. corneal infection, and many other disorders e.g. corneal infection, and many other disorders listed in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components.                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is kallikrein-like protein KLK-L3. Kallikreins and kallikrein-like proteins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding kallikrein-like proteins KLK-L1, KLK-L2, KLK-L3, KLK-L4, KLK-L5 and KLK-L6 have been isolated. The proteins are useful in the treatment, monitoring and diagnosis of cancers, especially prostrate cancer. They can also be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies can be used to treat conditions mediated by the kallikrein-like proteins.
                                                                                                                                                                                                                                                                                                       New kallikrein-like (KLK-L) proteins for diagnosing and treating KLK-L protein mediated disorders, especially cancer. -

(I) is useful as hybridisation probes, polymersae chain reaction (PCR) primers. Oilgomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity.
treatment, monitoring and diagnosis of cancers, especially prostrate cancer. They can also be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies can be used to treat conditions mediated by the kallikrein-like proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed
                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to novel serine proteases designated BSSP6 (AAB1712-B1174), and to nucleic acids encoding them (AAA61763-A61765). The invention also relates to vectors and transformants comprising BSSP6 nucleic acids; transgenic animals in which the expression level of BSSP6 can be varied; and an mBSSP6 knockout mouse. The invention additionally encompasses anti-BSSP6 antibodies and methods of production of such antibodies, methods of BSSP6 detection using the antibodies, and the medical conditions or fragments as diagnostic markers for certain medical conditions. Nucleotides encoding BSSP6 were initially isolated in a human brain cDNA library using degenerate PCR primers (AAA61795-A61796) based on conserved regions of serine proteases. The
specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Serine protease BSSP6, useful in detecting homologs, mutants and polymorphic variants as markers for diagnosis of Alzheimer's disease, epilepsy, cancer, inflammation, infertility and prostate hypertrophy,

The present sequence is that of the protein product of the megal gene identified in the megalomicin (meg) gene cluster (see AAF30757) of Micromonospora megalomicin (meg) gene (ATCC 27596, NRR1375).

It is proposed to be a polyketide synthase (PKS), specifically megalomicin 6-deoxyerythronolide B synthase 1, which shows 81% similarity to Eryal. The newly isolated meg gene cluster includes 3 PKS ORFs encoding enzymes involved in 6-deoxyerythronolide B (6-DBB) biosynthesis, and other ORFs encoding enzymes involved in the conversion of 6-DBB to megalomicin or deoxysugar biosynthesis. The invention provides nucleic acids encoding all or a portion of the megalomicin PKS and modification enzymes, which can be used to express recombinant enzymes in host cells for the production of megalomicin, megalomicin derivatives, and other polyketides, including hybrid PKS, useful as antibiotics, motilides and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acids encoding a domain of megalomicin polyketide synthase or megalomicin modification enzyme, useful for the production of megalomicin for use as antibiotics, motilides and antiparasitics -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               P-PSDB: AAB82207, AAB82208, AAB82209, AAB82210, AAB82211, AAB82212,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids encoding a domain of megalomicin polyketide synthase or megalomicin modification enzyme, useful for the production of megalomicin for use as antibiotics, motilides and antiparasitics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of the protein product of the megalIII gene identified in the megalomicin (meg) gene cluster (see AAF30757) of Micromonorspora megalomiciea subsp. nigra (ATCC 2798, NRRI3215).
It is proposed to be a polyketide synthase (PKS), specifically megalomicin 6-deoxyerythronolide B synthase (PKS), specifically similarity to EryAIII. The newly isolated meg gene cluster includes 3 PKS ORFs encoding enzymes involved in 6-deoxyerythronolide B (6-DEB) blosynthesis, and other ORFs encoding enzymes involved in the conversion of 6-DEB to megalomicin or deoxysugar biosynthesis. The invention provides nucleic acids encoding allo a portion of the megalomicin PKS and modification enzymes, which can be used to express recombinant enzymes in host cells for the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             N-PSDB; AAF30757.

AAW58063
                  ANY 45390 to AAY 48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour respection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, ALDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLS ex vivo for infusion back into a patient. The character of the immunogenic peptides are also useful
                                                                                                                                                                              Immunogenic peptide having a human leukocyte antigen binding motif #2667.
                                                                                                                                                                                                         Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma; vaccine; immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Southwood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 9;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Grey HM,

```
The present sequence represents a prostate specific antigen (PSA)

peptide. Monoclonal antibodies specific for PSA and hybridomas producing them have been developed. The antibodies: (a) bind to free PSA: (b) are monoclonal antibody 365 binding to amino acids 82-87 of free PSA (LKNPEL) or fragment, and (c) are monoclonal antibodies 10, 11, 16 or 22.2 and 15.2, 156 or 225 binding to amino acids 139-144 (EDELFLTP) and 55-60 (SLFHPE) respectively of free and bound PSA, or fragments. The antibodies are useful to detect PSA. For detecting free PSA only, an immunoassay comprising a solid support with attached labelled monoclonal antibody comprising a solid support with attached labelled monoclonal antibody in the first solid support. The antibodies are useful in cancer screening, especially prostate and breast cancer. By obtaining total and free PSA (especially prostate and breast cancer. By obtaining total and free PSA (especially prostate and breast cancer. By obtaining total and free PSA (especially prostate and breast cancer. By obtaining total and free PSA (especially prostate and breast cancer. By obtaining total and free PSA (especially prostate and breast cancer. By obtaining total and free PSA (especially prostate and breast cancer. By obtaining total and free PSA (especially prostate and breast cancer. By obtaining total and free PSA (especially prostate and presented to separate prostatic cancer (PCa) from beautomer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              benign prostatic hyperplasia (BHP) patients. Measurement of PSA is also useful after radical prostatectomy, to predict disease persistence. The antibodies allow evaluation of FSA free/total ratio, enabling separation of BPH and PCa patients with PSA values 4-10 ng/ml not previously
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
Human; prostate specific antigen; PSA; epitope; monoclonal antibody; detection; cancer; serine protease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Monoclonal antibodies specific for prostate specific antigen - useful, e.g. in screening for prostate or breast cancer and especially to distinguish between benign prostatic hyperplasia and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a prostate specific antigen (PSA)

peptide. Monoclonal antibodies specific for PSA and hybridomas producing

them have been developed. The antibodies: (a) bind to free PSA; (b) are

monoclonal antibody 365 binding to amino acids 82-87 of free PSA (LKNREL)

or fragment, and (c) are monoclonal antibodies 10, 11, 16 or 22.2 and

15.2, 156 or 225 binding to amino acids 139-144 (EEFFITP) and 55-60

(SLFHPE) respectively of free and bound PSA, or fragments. The antibodies

are useful to detect PSA. For detecting free PSA only, an immunoassay

comprising a solid support with attached labelled monoclonal antibody

specific for free PSA (especially (b)) and a PSA standard can be used.

To detect both free and bound PSA, a second solid support with attached

(differently labelled) monoclonal antibody binding free and bound PSA

(especially selected from (c)) can be used either with, or in place of,

the first solid support. The antibodies are useful in cancer screening,

especially prostate and breast cancer. By obtaining total and free PSA

values, their ratio can be used to separate prostatic cancer (PCa) from

seful after radical procedules (PCA) from the procedules and procedu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  useful after radial prostatectomy, to predict disease persistence. The antibodies allow evaluation of PSA free/rotal ratio, enabling separation of BPH and PCa patients with PSA values 4-10 ng/ml not previously possible by total PSA testing, avoiding biopsies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present sequence represents a novel peptide which has 20 contiguous amino acids derived from the 240 residue sequence of the human prostate specific antique (PSA) (see AAM1023). The preferred peptide has two hydrophobic regions and one hydrophilic region each of about 5 as in length, arranged as follows: hydrophobic-hydrophilic-hydrophobic. Polyclonal antisera specific for the antigent peptide may be used in a method for disagnosing prostate cancer in vivo or in vitro. The peptide represents a sequence unique to PSA which does not cross react with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

kallikrein useful in the development of prods. used in the diagnosis and monitoring of prostate cancer. Recombinant hK2, contg. an exogenous N-terminal methionine, can be produced in prokaryotic (E. Coll) or eukaryotic (insect, mammalian) systems using cDNA (AAT05148) derived from human benign prostatic hyperplasia tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated prostate-specific kallikrein polypeptide(s) - used to develop prods. for use in assays for such polypeptide(s), partic. for diagnosis and monitoring of prostate cancer

                                                                                                                                                                                                                                                                                                                                                                                                           AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens. The colon cancer antigens have cytostatic acitivity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, adaquosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own roduction of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inscrting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB37789 represent sequences used in the exemplification of the

The present invention describes a diagnostic method for detecting human kalikrein 2 (hK2) DNA. The method comprises: (a) contacting DNA obtained by reverse transcription (RT) of RNA from a human physiological sample which comprises cells suspected of containing hK2 RNA with at least 2 oligonuclectides to amplify the DNA by PCR to yield amplified hK2 DNA, where the conditions amplify the DNA obtained by RT of RNA from at least one cell containing hK2 in a sample which comprises at least 107 to 109 cells; and (b) detecting the presence of the amplified hK2 DNA. The method can be used for detecting, monitoring the progression of and pathologically staging prostate cancer. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0; Gaps

                                                                                                                                                                                                                                                                     ò
                                                                                          The present invention describes a diagnostic method for detecting human kallkrein 2 (NK2) DNA. The method comprises: (a) contacting DNA obtained by reverse transcription (RT) of RNA from a human physiological sample which comprises cells suspected of containing hK2 RNA with at least 2 oligonucleotides to amplify the DNA by PCR to yield amplified hK2 DNA, where the conditions amplify the DNA by PCR to yield amplified hK2 DNA, one cell containing hK2 in a sample which comprises at least 107 to 109 cells; and (b) detecting the presence of the amplified hK2 DNA. The method can be used for detecting, monitoring the progression of and pathologically staging prostate cancer. The present sequence represents prostate-specific antigen protein hK3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               kallikrein 2 (hK2) DNA. The method comprises: (a) contacting DNA obtained by reverse transcription (RT) of RNA from a human physiological sample which comprises cells suspected of containing hK2 RNA with at least 2 oligonucleotides to amplify the DNA by PCR to yield amplified hK2 DNA, where the conditions amplify the DNA obtained by RT of RNA from at least one cell containing hK2 in a sample which comprises at least 107 to 109 cells; and (b) detecting the presence of the amplified hK2 DNA. THE STATE OF THE S

```
The present sequence represents the mature form of the mutant human prostate specific glandular Kallikrein 2 (hK2) A217V protein. The mutant hK2 protein was used in the method of the invention. The invention provides a diagnostic method for detecting hK2 DNA within a physiological sample. The method involves amplifying DNA, obtained by reverse-transcriptase PCR reaction of RNA from a human sample, using primers where at least one of the primers is a hK2 specific primer. Bxpression of the wild-type hX2 protein (AAM49085) can be detected using hK2 specific antibodies. As hK2 is a marker for prostatic cancer (PC), the method is claimed to be useful for detecting metastatic PC or persistence of PC after radical prostatectomy. Mutant hK2 can be used in assays for detection of wild-type hK2 protein. The method is also claimed to be useful for monitoring the progress of the disease or its
                                                                                                                                 ö
method can be used for detecting, monitoring the progression of and pathologically staging prostate cancer. The present sequence represents prostate-specific glandular kallikrein protein (MK2).
                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting human prostate-specific kallikrein-2 by DNA amplification for diagnosis of metastatic prostatic cancer and monitoring the

Monoclonal antibodies specific for PSA and hybridomas producing them
have been developed. The antibodies: (a) bind to free PSA: (b) are
monoclonal antibody 365 binding to amino acids 82-87 of free PSA (LKNREL)

or fragment, and (c) are monoclonal antibodies 10, 11, 16 or 22.2 and
15.2, 156 or 225 binding to amino acids 139-144 (EBELTP) and 55-60

(SLFHPE) respectively of free and bound PSA, or fragments. The antibodies
are useful to detect PSA. For detecting free PSA only, an immunoassay
comprising a solid support with attached labelled monoclonal antibody
specific for free PSA (especially (b)) and a PSA standard can be used.
To detect both free and bound PSA, a second solid support with attached
(alfferently labelled) monoclonal antibody binding free and bound PSA
(aspecially selected from (c)) can be used either with, or in place of,
the first solid support. The antibodies are useful in cancer screening,
especially prostate and breast cancer. By obtaining total and free PSA
values, their ratio can be used to separate prostatic cancer (PCa) from
benigh prostatic hyperplasia (BHP) patients. Measurement of PSA is also
useful after radical prostatectomy, to predict disease persistence. The
antibodies allow evaluation of PSA free/fotal ratio, enabling separation
of BPH and PCB patients with PSA values 4.10 ng/ml not previously
possible by total PSA testing, avoiding biopsies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This polypeptide comprises human mature prostate-specific glandular kallikrein hK2. It is encoded by CDNA (see AAV06602) derived from human benign prostate hyperplasia (BPH) tissue RNA. The invention provides a diagnostic method comprising contacting antibodies that specifically bind to pro-HK2 (phK2, see AAW45396) or mature hK2 with a sample of physiological fluid from a human. The assay is based on the discovery that phK2 is detected in the supernatant of a prostate carcinome cell line and that hK2 is present in human physiological fluid from prostate cancer cells. The method is useful for monitoring the treatment and/or prostate cancer in males that have BPH or a high grade prostatic neoplasia (HPGN) or whose family members have or had BPH, HPGN or a prostate cancer. Monitoring the presence and/or amount of hK2 complexes with plasma proteins may also be important in distinguishing between prostate cancer and BPH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This polypeptide comprises human prostate-specific antigen (PSA)

hK3. PSA levels are widely used as a prognostic indicator of

prostate carcinoma. The invention provides a novel diagnostic

method comprising contacting antibodies that specifically bind to
human prostate-specific glandular kallikrein protein hK2 (see

W453950 or pro-hK2 (phK2, see AAW45396), but not with PSA, with a

sample of physiological fluid from a human. The assay is based on
the discovery that phK2 is detected in the supernatant of a

prostate carcinoma cell line and that hK2 is present in human

physiological fluid from prostate cancer cells. The method iss

useful for monitoring the treatment and/or progression of prostate
cancer, or for the early detection of prostate cancer in males that
cancer, or for the early detection of prostate cancer in males that
members have or had BPH, HPGN or a prostate cancer. Monitoring the
presence and/or amount of hK2 complexes with plasma proteins may
also be important in distinguishing between prostate cancer and BPH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Diagnostic methods using antibodies which bind prostate antigens useful for, e.g. monitoring treatment or progression of prostate % \left( 1\right) =\left\{ 1\right\} =

Human kallikrein 2 (hK2) is expressed at elevated levels relative to the prostate cancer antigen, prostate specific antigen (PSA) by breast cancer cells when stimulated by androgens. Detecting levels of hK2 may provide a simple diagnostic tool for detecting levels determining breast cancer. Detecting hK2 is achieved by producing an hK2 DNA from hK2 RNA by reverse transcription. The hK2 DNA bottained is then amplified by PCR and detected using probes. Determination of breast cancer may also be determined by exposing the hK2 polypeptide to an agent which binds to it and then detecting the binary complex formed. The amount of complex formed correlates directly to the presence of breast cancer in the human individual. The methods can be used in the diagnosis, treatment and/or monitoring by the progression or remission of breast cancer and/or

the prostate cancer antigen, prostate specific antigen (PSA) by breast cancer calls when stimulated by androgens. Detecting levels of hK2 may provide a simple diagnostic tool for detecting levels of hK2 may provide a simple diagnostic tool for detecting or determining breast cancer. Detecting hK2 is achieved by producing an hK2 DNA from hK2 RNA by reverse transcription. The hK2 DNA from hK2 RNA by reverse transcription. The hK2 DNA contained is then amplified by PCR and detected using probes. Determination of breast cancer may also be determined by exposing the hK2 polypeptide to an agent which binds to it and then detecting the binary complex formed. The amount of complex formed correlates directly to the presence of breast cancer in the human individual. The methods can be used in the diagnosis, treatment and/or monitoring of the progression or remission of breast cancer and/or type hK2 levels. This variant of hK2 differs from the wild type hK2 levels. This variant of hK2 differs from the wild position 217.
                                                                                                                                                                                                                                                                                                                        Human kallikrein 2 (hK2) is expressed at elevated levels relative to
                                                                                                                                                                                                                      Use of human kallikrein 2 - as a marker for developing products for the diagnosis, prognosis, monitoring and treatment of breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Prostate-specific antigen; PSA; human; detection; prostatic cancer; isoform-specific monoclonal antibodies; marker.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the prostate cancer antigen, prostate specific antigen (PSA) by breast cancer cells when stimulated by androgens. Detecting levels of hKZ may provide a simple diagnostic tool for detecting levels of hKZ may provide a simple diagnostic tool for detecting levels an hKZ DNA from hKZ NRA by reverse transcription. The hKZ DNA cobtained is then amplified by PCK and detected using probes. Determination of breast cancer may also be determined by exposing the hKZ ptypeptide to an agent which binds to it and then detecting the binary complex formed. The amount of complex formed correlates directly to the presence of breast cancer in the human individual. The methods can be used in the diagnosis, treatment and/or monitoring of the progression or remission of breast cancer and/or monitoring hKZ levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                       Use of human kallikrein 2 - as a marker for developing products for the diagnosis, prognosis, monitoring and treatment of breast cancer

                                                                                                                                                                                    ö
                                                       This invention describes a novel composition (A) having a total concentration of prostate-specific antigen (PSA). (A) is useful as a reference in methods for detecting PSA (a marker for prostatic cancer) in human blood or serum and to generate isoform-specific monoclonal antibodies (MAb) against PSA, for use in immunological assays. (A) contains all the isoforms of PSA and can be isolated without significant formation of artefacts by autoproteolysis. Antibodies specific for particular PSA isoforms can improve diagnostic specificity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel prostate specific antigen (PSA) for distinguishing benign prostatic hyperplasia from prostate cancer, comprises a clip at lysine 182 of the amino acid sequence of a mature form of PSA -
                                                                                                                                                                                    Gaps
Composition containing isoforms of prostate-specific antigen, useful a reference standard for analysis and for producing isoform-specific
                                                                                                                                                                                                                                                                                                                                Prostate specific antigen elevated in benign prostatic hyperplasia

Distinguishing prostate cancer from benign prostatic hyperplasia using different forms of prostate specific antigen contained in a sample involves mathematically combining amounts of ProPSA and BPSA -
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
prostate specific antigen (PSA). This form of PSA has at least 1 clip at Lys-182 and may additionally have 1 or more clips at Lys-1, Lys-145 and Lys-146. Preferably, the PSA contains at least 2 clips at Lys-145 and Lys-182. The novel forms of PSA exist at an elevated level in patients suspected of having benign prostatic hyperplasmia (BPH) and therefore may be used as a serum marker or an immunohistological marker to help distinguish BPH from prostate cancer. Antibodies recognising the novel forms of PSA and immunoassays that detect and determine the novel forms of PSA are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a mature form of a novel form of prostate specific antigen (PSA). This form of PSA has at least 1 clip at Lys-182 and may additionally have 1 or more clips at Lys-1, Lys-145 and Lys-146. BPSA, a form of PSA that comprises at least 1 clip at Lys-182, exists at an elevated level in the transition zone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               benign prostatic hyperplasia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Prostate specific antigen specific to benign prostatic hyperplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      peptide bond cleavage"

The present sequence represents human prostate specific antigen (PSA) which is used to produce novel peptides derived from the 240 residue sequence. The preferred peptides have two hydrophobic regions and one hydrophilic region each of about 5 am in length, arranged as follows: hydrophobic-hydrophilic-hydrophobic. Polyclonal antisera specific for the antiqualic peptides may be used in a method for diagnosing prostate cancer in vivo or in vitro. The peptides represent a sequence unique to PSA which does not cross react with certain kallikreins.
                                                                                                                                                                                                                  PSA; kallikrein; prostate cancer; antigenic; polyclonal antisera.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antigen peptide derived from prostate specific antigen - does no cross react with related kallikreins, for diagnosis of prostate

Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention.

The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TMF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also proteins can be used to determine the presence of tumours and also proteins can be used to determine the presence of tumours and also breast, prostate, rectal, cervical, or liver tumours, in mammalian breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cell proliferation, immunomodulatory; autoimmune disorder; antimicroblal; multiple sclerosis; rheumatoid arthritis; insulin-dependent diabetes; haematopoiasis; tissue growth activity; Parkinson's disease; cytostatic; Huntington's disease; Alzheimer's disease; chemotactic; chemokinetic; haemostatic; thrombolytic; tumnour growth inhibitor; anabolic; contraceptive; antiinfertility; antlinflammatory.

                                                                                                                                            The present sequence is human protein with hydrophobic domain, HP03934. The polynucleotide and polypeptide of the invention may be used in the prevention, diagnosis and treatment of diseases as sociated with inappropriate polypeptide expression. The polynucleotides may be used to produce the polypeptide, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. The polynucleotides and its complementary sequences may also be used as DNA probes in diagnostic assays and also used in gene therapy. The polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators of polypeptide expression and cultuity. The polypeptides and nucleic acids may be used as nutritional supplements, to modulate cytokine and cell proliferation activity, to modulate immune stimulation or suppression (e.g. for the treatment of microbial infections and autoimmune disorders such as multiple sclerosis, rheumatoolesis, to modulate insulin-dependent diabetes), to modulate controlling and modulate the sclerosis, to modulate controlling and insulin-dependent diabetes), to modulate controlling and modulate dependent diabetes).
                                                                                                                                                                                                                                                                                                                                                                                                                        treatment of Parkinson's disease, Huntington's disease and Alzheimer's disease), to modulate activin and inhibin activity (e.g. for controlling fertility), to modulate chemotactic and chemokinetic activity, to modulate haemostatic and thrombolytic activity, to modulate receptor ligand activity, to modulate receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; PRO; dermatological; antipsoriatic; cytostatic; antinflammatory; antiparkhisonian noctropic; neuroprotective; vulnerary; cardiant; antianglogenic; vasotropic; antiasthmatic; antirheumatic; cancer; antiarthritic; antinfertility; antidiabetic; antiviral; diabetes; ophthalmological; gene therapy; skin disease; gastrointestinal disorder;
                                          Human proteins with hydrophobic domains and the nucleic acids encoding them, useful for preventing diagnosing and treating e.g. cancer, Alzheimer's and inflammation -
